1.0 IMPORTANT NOTICE & INTRODUCTION

IMPORTANT NOTICE

Please read before attempting service

1. While the monitor is in operation, do not attempt to connect or disconnect any wires.
2. Make sure the power cord is disconnected before replacing any parts in the monitor.
3. When the power is on, do not attempt to short any portion of the circuit. This shorting may cause damage to the transistors in the monitor.
4. When servicing the H.V. area, be certain that the CRT anode is safely discharged before removing the anode cap.
5. Caution must be exercised when servicing this monitor.

INTRODUCTION

Enhanced repair capabilities

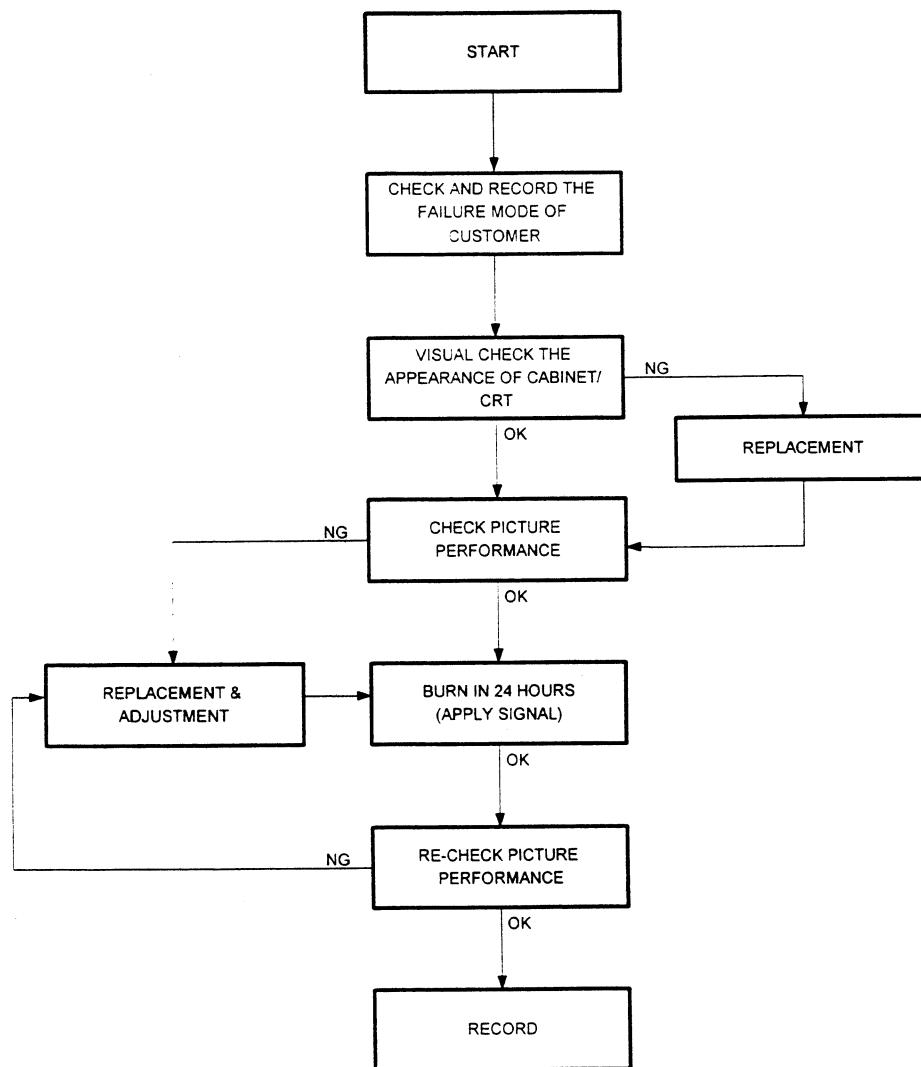

This troubleshooting guide is edited for model 1569E/SE when service is necessary. There are four primary parts included in this troubleshooting guide which offer the easiest way to locate problem points and repair the machine to the best possible condition.

1. The Adjustment section offers the adjustable method, steps and all data of the factory's initial settings which can make the machine get the best performance at that time. By the way, before adjusting, the machine must be warmed up for at least 10 minutes and the CRT face must be in an eastward direction.
2. The Troubleshooting section has four main parts including power supply, power saving CRT, deflection & video circuit. Each offers fast repair routine and the IC, transistor voltage records against all specified signal modes. These voltage readings are measured with a HP 34401A multimeter with input impedance $10M\Omega$ ($0.1V \sim 1000V$ range) and waveforms shown on circuit schematics are measured by a Tektronix TDS 520 digital

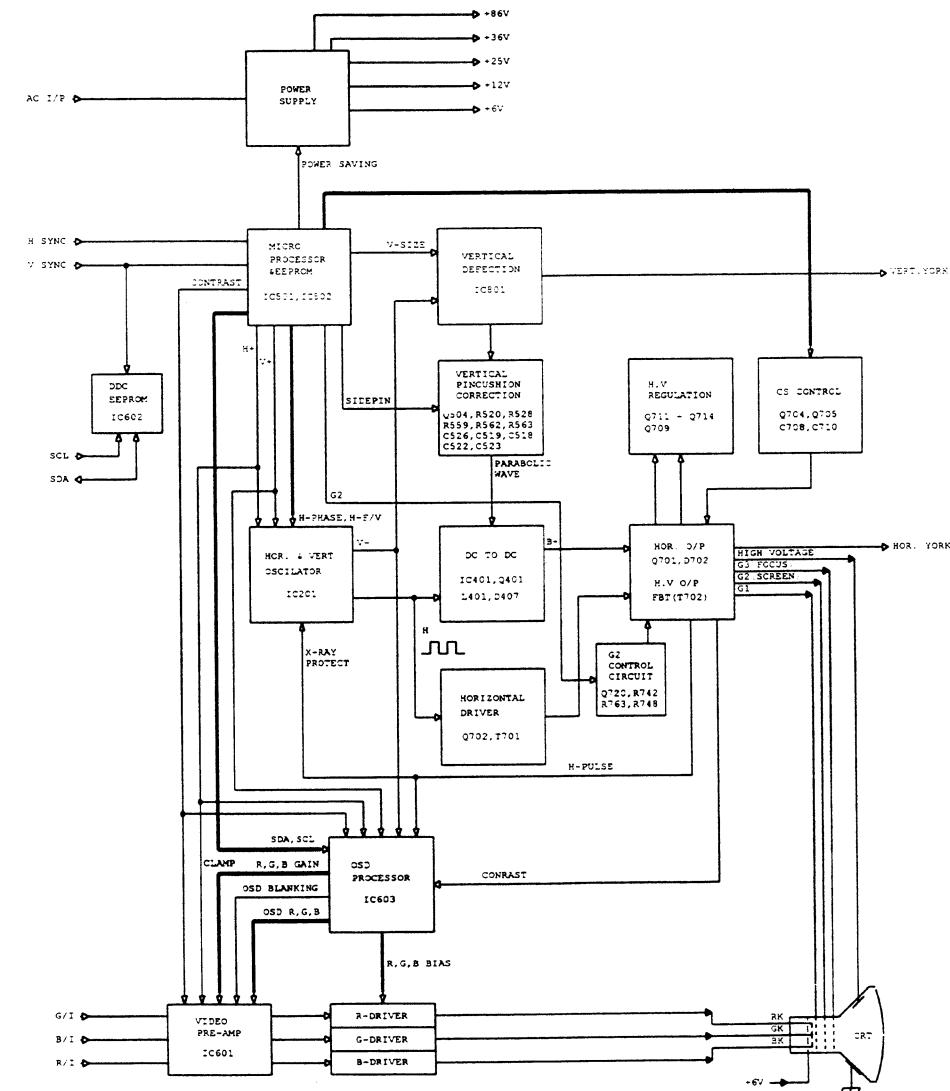

oscilloscope, the monitor receives VGA-480 full white square pattern.

3. The CRT contrast list offers repairmen / technicians the contrast data when CRT replacement is necessary from a different type of CRT.
4. The Spare parts list offers the CTX part number (P/N) which is used frequently by repairmen / technicians. For details please refer to the service guide or service manual. If there's any engineering change regarding this mode, CTX will issue the updated information by a non-periodical Technical Bulletin.

2.0 GENERAL MAINTENANCE PROCEDURE

3.0 FUNCTION BLOCK DIAGRAM

4.0 DESCRIPTION OF CIRCUIT

1. Power supply circuit

The power supply is a "serial & universal AC input" switching power supply. The start up circuit will provide a DC voltage for PWM (Pulse Width Modulation) IC (IC101) when power on. When IC101 works normal start up circuit Q101 will cut off the DC voltage IC101 will auto-detect output voltage of V1 from pin2 and correct the duty cycle of pin6 output pulse to compensate the variation of output voltage.

The output of IC101 connected to power mosfet to drive the power transformer T101. When power mosfet is on, the energy stored in the primary winding of T101. Once mosfet is off, the energy transfer to the secondary and charges the output capacitor to get the stable DC voltage.

2. Oscillation circuit

Form Pin1~Pin13 of IC201 are for horizontal oscillation and Pin15~Pin19 are for vertical oscillation. The Pin2 is H-sync input, through Pin2 & 3 are for phase control, and then output to A.F.C (Auto Frequency Control). The H-phase from horizontal output circuit is sent to Pin4 for saw tooth generator. The Pin7 is A.F.C output connected to O.S.C control circuit to make the output frequency stable. The Pin12 is square wave output and connected horizontal output stage & H.V output stage Pin13 is X-RAY protect input. When H.V output circuit is abnormal (H.V too high), the X-RAY protect circuit will shut off the horizontal output. H.V. also will be shut down.

3. Horizontal output circuit

The H.V adjustment circuit consist of C703, Q709 and H.V regulation (Q711, Q712, Q713, Q714, IC701) which control the H.V output level. The duty cycle of Q709 gate directly control output voltage of C703. The C703 is a supply capacitor which supply the energy to primary winding of FBT and Q701 switch repeatedly to transfer the energy to FBT secondary winding.

4. Micon circuit

The IC501 (CPU) will detect polarity and frequency of input H.V Sync.. The CPU will determine the mode of input timing (preset or users mode) and load data from IC502 (E²PROM). The output of IC501 were connected the other function (ie. H-SIZE, V-SIZE, H-PHASE....) Also, the user can adjust picture from keyboard and the data will be saved into IC502 automatically. For the O.S.D mode, when O.S.D manual is active CPU will infrom the OSD IC to send O.S.D BLK signal to blank the video signal from VGA card and the IC603 (O.S.D IC) will send O.S.D R-G-B video signal the consist the O.S.D manual.

| IC501 | Function control |
|----------|-------------------|
| Pin1 | H-phase |
| Pin2 | G2 |
| Pin3 | Contrast |
| Pin17~19 | H-linearity |
| Pin20,21 | Power saving |
| Pin22 | Degauss |
| Pin23 | Mute |
| Pin32,33 | H & V Sync output |
| Pin35 | Parallel |
| Pin36 | Keystone |
| Pin37 | Side-pin |
| Pin38 | V-position |
| Pin39,40 | H & V Sync input |

5. DC-DC convertor circuit

Due to output DC voltage is higher than input DC voltage we call the circuit step-up DC-DC regulator. The PWM control IC3843 is kernel of the circuit. The 3843 will detect the output of H-O/P and then change the duty of Pin6. When Q401 is on, the energy stored in the secondary of power transformer. The energy will be released and to get the B+ when Q401 turn off. So, the input duty cycle of Q401 gate is higher, the output B+ is higher.

6. Vertical output circuit

The vertical pulse from oscillation IC201

(LA7851) is sent to Pin2 of vertical IC (LA7838). The amplifier output Pin12 drives the vertical deflection will directly. Voltage setting on Pin4 determines the peak level of the saw-tooth ramp, thus can be used as vertical height control. The DC feedback is sent to Pin7 of vertical IC (LA7838) adjusting VR801 can achieve best linearity.

7. Video output circuit

Video circuit consists of video preamplifier IC601 (M52737SP) and output cascode amplifier with RLC peripherals. IC601 is a Video processing IC equipped with three DC amplifiers to pre-amplify R.G.B signals form 0.6V to 3V. The voltage gain of these amplifiers are call DC controlled from Micro processor. The R.G.B GAIN & BIAS control signal are from DACs of OSD IC(STV9422). So simple voltage drive with resistors and timers can be used to adjust the voltage GAIN and BIAS of each RGB signal's amplification and thus achieve a well balanced white picture.

The OSD IC is to control picture of OSD window. The video output stage contains three identical cascode amplifiers to amplify the video signal from IC601 to capable of driving CRT.

7.6 DEFLECTION CIRCUIT TROUBLESHOOTING ROUTINE

7.6.1 Horizontal Deflection Circuit

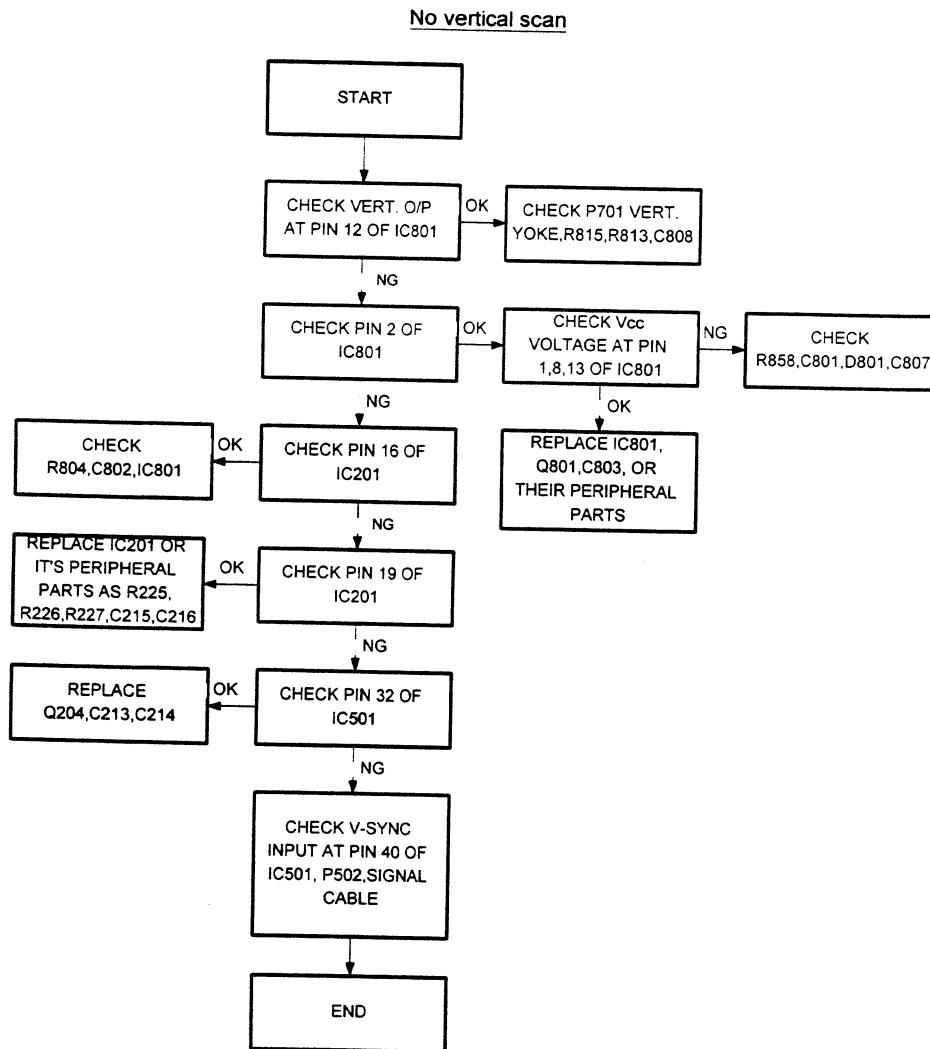

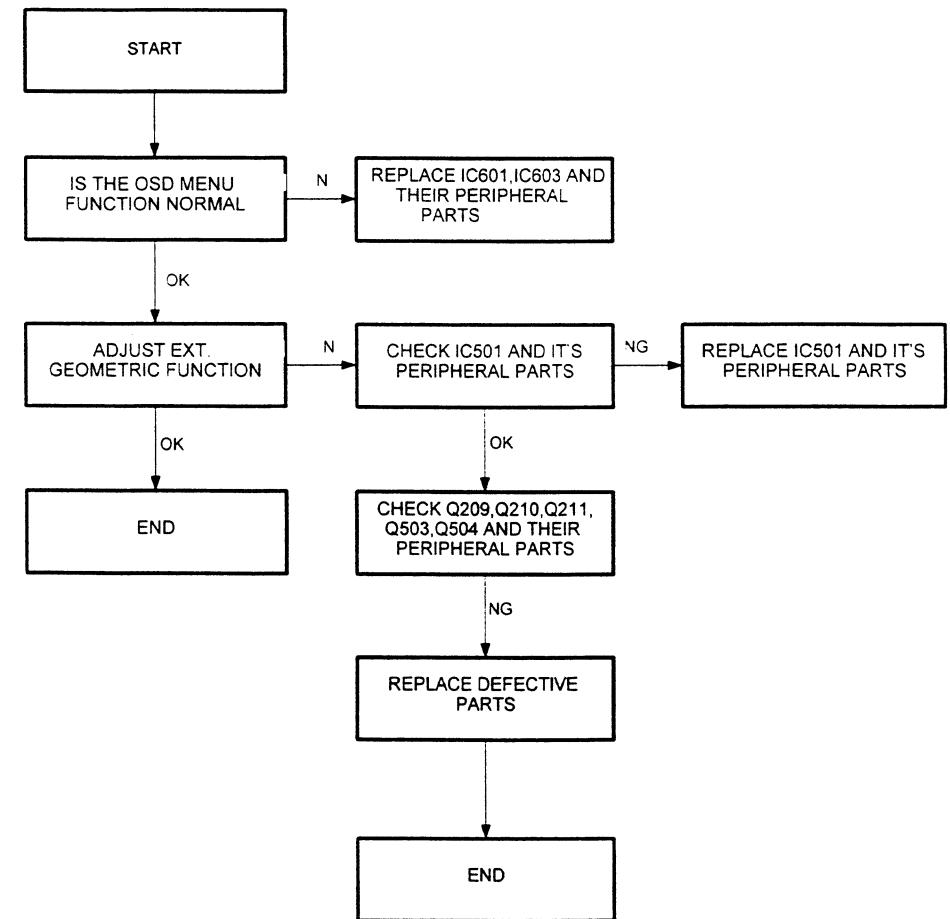

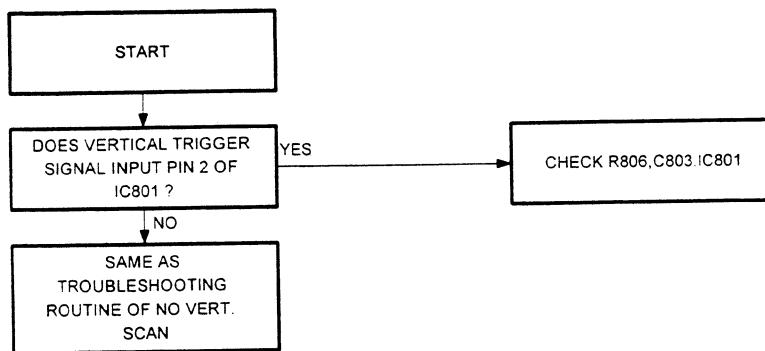

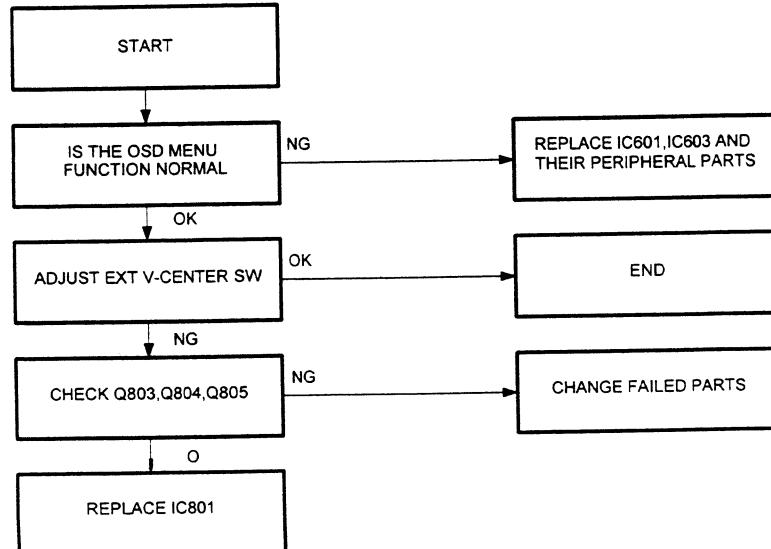

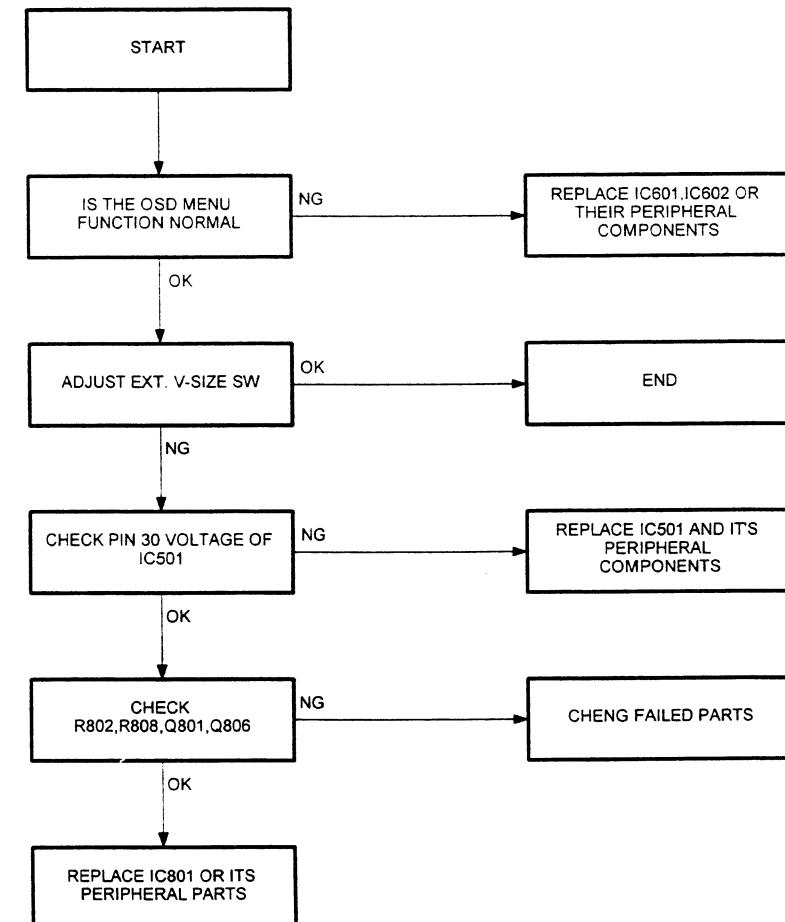

Linearity

REMARK: * "L" means the voltage between gate and source is $< 4V$ which can't turn on the MOSFET.
 ** "H" means the voltage between gate and source is $\geq 4V$ which can turn on the MOSFET.

Out of phaseWidth Abnormal

7.6.2 Vertical Deflection Circuit

10.0 PARTS LIST

1569E/SE Parts List

Abbreviations : Capacitors EL: Electrolytic Aluminum, TA: Tantalum, CE: Ceramic
 PP: Polypropylene, PEI: Polyester (Inductive),
 PEN:Polyester (Non-Inductive)PPS:Serial Poly Propylene,
 MPE:Polyester Metallized, MPP:Polypropylene Metallized.
 Resistors..... CF: Carbon Film, MF: Metal Film, VR: Variable Resistor.
 MOF: Metal Oxide Film, POT:Potentiometer
 Semiconductor... TR: Transistor, DI: Diode, ZD: Zener Diode, IC: IC.
